ABSTRACT OF THE DISCLOSURE

A main unit address restricted notification system has a main unit, two or more subordinate terminals which acquire an IP address of said main unit at a connection start, an
5 address administration unit having a DHCP function, and a transmitting line for connecting these. The address administration unit attaches terminal identification information to a DHCP message from the subordinate terminals to the address administration unit at a connection start and
10 also the address administration unit comprises a terminal identification information authorizing part which authorizes terminal identification information received and a main unit IP address information notifying unit which notifies only terminals which have passed the authorization of main unit
15 IP address information.
